## (57) Abstract:

**PROBLEM TO BE SOLVED:** To effectively utilize the resources of a network address and to omit the communication procedures for authentication processing by controlling communication with a 2nd server from a communication terminal on the basis of information on communication with a 1st server.

**SOLUTION:** Management information managed by an MS management/charging server is transferred between an information providing server 10 and a multimedia stream server 15 to make it possible to realize a link between the two servers. A terminal management number is allocated to the information and the information is managed as an access log. A terminal number is a telephone number allocated to a terminal. A network ID is an IP address allocated by a service network, and access to a server is managed with the IP address. A service class is information showing whether service used by a multimedia terminal 2 is service obtained by

utilizing text data obtained by utilizing an information providing content server 105.
